

Fork Positioner for Forklifts

Fork Positioner for Forklift - The fork positioner is a hydraulic device which allows the the one driving to control the forklift without leaving the seat. They are made out of top quality materials and are meant to endure the most difficult operations and work environments. Side shifting units have the extra ability to be able to laterally position the entire load or the arms so as to facilitate more precise lifting and position in a quicker and much more effective way.

The unique blade pocket design could enable the person operating it to securely swing the unit's forks without any worry of damaging the positioning cylinders. This allows the operator the choice to either execute simultaneous or independent fork movement, dependent upon the job requirement. For most lift trucks with non-OEM carriages, complete carriages are required. Standard OEM carriages could be transformed into fork positioners on available units.
